

The gold layer gets acted on, not just queried

Activations is the fourth native NewCo stage, right after Transformations. The instant gold.fct_retention_signals shows a student newly crossing a retention_risk_score of 80 or higher — dfw_count_term at 2+, a 7-day LMS engagement drop past 40%, a missed advising touch — Activations opens a case straight in EAB Navigate360, the tool advisors are already staring at. No CSV export, no Monday re-key, no analyst in the loop.

TRIGGER risk_score ≥ 80 newly crossed · no open case yet	DESTINATION EAB Navigate360 Student Case · insert	TIME TO CONTACT 9 days → 14 min median, flag to first advisor contact
WHAT YOU SAY	WHAT YOU SHOW	
"Right now, 1,204 students sit flagged in gold.fct_retention_signals — two or more early-alert signals, DFW risk, LMS engagement dropping, a missed advising touch. That table's correct the second dbt finishes the build. But today, an advisor doesn't see any of it until someone exports a CSV every Monday and re-keys it into Navigate360. Nine days, median, flag to first contact. That's Activations' job — not a dashboard, a sync."	Architecture page → Activations panel, Trigger column	
"Watch one student's row: dfw_count_term ticks to 2, LMS engagement drops 40% over seven days, retention_risk_score crosses 80."	/activations-live → Segment Definition → Field Mapping steps	
"Cut to Navigate360: a new case appears seconds later — advisor_id, risk_score, and dfw_count_term already populated. No CSV in sight."	/activations-live → Sync Preview → API Push steps	
"Time-to-contact: nine days to fourteen minutes. 48-hour contact rate: 41% to 92%. Roughly \$1.1M in preserved tuition this term, across the flagged cohort."	/activations-live → Destination Confirmation table	
"Before, this was a spreadsheet bolted on after the fact. Now it's one platform, one lineage graph, and the advisor is never the last to know."	Architecture page → Before/After panel, Reverse-ETL hop row	

FIELD MAPPINGS · GOLD → EAB NAVIGATE360 STUDENT CASE

dim_students.student_id → external_student_id · fct_retention_signals.retention_risk_score → risk_score · fct_dfw_risk.dfw_count_term → flag_count · dim_students.advisor_id → assigned_staff_id · fct_retention_signals.last_lms_login_at → last_activity_date

Trigger fires only on newly-crossed risk (advising_case_status != 'open'), so advisors never receive a duplicate alert for the same student. Synthetic data — Cascade University is a fictional demo entity.
